Developing Facebook Plugins

Applications with Code

Facebook provides a set of APIs and SDKs that allow developers to create applications that integrate with the Facebook platform. The Facebook Platform is a collection of tools and services that enable developers to build applications that can be used on the Facebook website, on mobile devices, and on other platforms.

The Facebook Platform is designed to be easy to use and to provide a high level of security. It includes a set of APIs that allow developers to access user information, post to the user's timeline, and perform other actions. It also includes a set of SDKs that make it easy to integrate Facebook functionality into applications.

Developers can use the Facebook Platform to create a wide variety of applications, from simple social networking tools to complex business applications. The Facebook Platform is a powerful tool that can help developers create applications that are both useful and secure.

For more information about the Facebook Platform, visit the Facebook Platform website at <https://developers.facebook.com/docs>.
